EDUCATION

Vellore Institute of Technology (VIT)

B.Tech. Computer Science; CGPA: 8.51 / 10

Vellore, India

2023 – 2027

TECHNICAL SKILLS

Languages: Java, Python, JavaScript, TypeScript, C++, SQL

Backend & APIs: Spring Boot, FastAPI, Node.js, Express.js, REST APIs, JWT, WebSockets, Server-Sent Events

Frontend: React, Tailwind CSS, HTML5, CSS3

Databases: MySQL, MongoDB, Redis, SQLite, Supabase (pgvector), SQLAlchemy

AI & Cloud: LangChain, RAG, Multi-Agent Systems, Vision LLMs, Groq, AWS (S3, Bedrock), NVIDIA NIM, OpenAI API

Tools & Testing: Git, Docker, Postman, Jest, Swagger/OpenAPI, n8n, HubSpot CRM, OpenCV, Mediapipe

Core CS: Data Structures & Algorithms, System Design, REST API Design, OOP

EXPERIENCE

Product & AI Engineering Intern

Mumbai, India

LEAD Group (Leadership Boulevard Pvt. Ltd.)

May 2026 – July 2026

- Built **AR Co-Pilot**, an AI-powered Accounts Receivable validation platform on a modular “Checklist-as-a-Service” architecture (FastAPI, SQLAlchemy, React, TypeScript), automating manual PO reviews of about 20 minutes each.
- Engineered a 3-stage PO reconciliation pipeline: document retrieval from AWS S3 via ORP MySQL references, extraction of 5–20 line items per PO with a Llama 4 Scout vision LLM, and reconciliation to flag unauthorized lines.
- Designed a 2-stage engine where the LLM performs only semantic item matching while deterministic Python handles all quantity comparison and verdict logic, keeping every financial decision auditable and hallucination-free.
- Shipped a provider-agnostic LLM layer spanning 2 providers (Groq, with AWS Bedrock fallback) via LangChain, plus a finance-editable matching-rules studio for adjusting logic without code changes.
- Extended the platform with a deterministic deal-validation service reconciling PAN records from Google Sheets against HubSpot CRM via an n8n government-lookup webhook, classifying each into 5 audit verdicts.

Software Development Intern

Jaipur, India

Fudr

May 2025 – July 2025

- Restructured Swagger/OpenAPI documentation for a production Spring Boot backend using GroupedOpenApi, organizing 66 controllers into module-specific groups, tags, and definitions for internal and external API consumers.
- Implemented field-level data exposure control with `@JsonView` and logic to hide internal endpoints from public documentation, tightening the API security surface.
- Integrated MySQL data flows and provisioned Redis in the backend; replaced hardcoded values with constants and refactored legacy configurations to improve maintainability of the codebase.
- Diagnosed and resolved critical production issues spanning JVM arguments, dependency conflicts, and security manager constraints, and untangled Spring Boot bean dependency cycles in a live environment.

TECHNICAL PROJECTS

Citizen Saathi | *Agentic AI Civic Assistant* | FastAPI, React, LangChain, Supabase pgvector | [GitHub](#)

2026

- Orchestrated a 3-agent pipeline (Planner, Retriever, Advisor) that recommends Indian government welfare schemes, decomposing each user query into retrieval and advisory sub-tasks.
- Architected hybrid retrieval fusing 2 sources, Supabase pgvector semantic search and live Tavily web scraping, to anchor responses in curated scheme data and current web results.
- Applied RAG-grounded synthesis with deterministic eligibility rules in the Advisor agent, eliminating hallucinated recommendations across 50+ supported schemes.
- Deployed the full application on Vercel with Supabase, swapping between 2 LLM backends, Groq (Llama 3.3) and NVIDIA NIM (Llama 3.1), through environment configuration.

TravelBuddy | *Ride-Sharing Web Application* | React, Tailwind CSS, Node.js, MongoDB | [GitHub](#)

2025

- Created a full-stack ride-sharing platform where users schedule trips, request rides, and manage bookings.
- Developed RESTful APIs on Node.js and MongoDB powering ride requests, booking workflows, and user notifications.
- Crafted a responsive React and Tailwind CSS interface for scheduling and managing rides across devices.

Event RSVP & Management Platform | *Node.js, Express, MongoDB, React, WebSockets, JWT, Nodemailer*

2025

- Delivered a full-stack RSVP platform with MVC architecture and secure bcrypt-hashed JWT authentication for event organizers and attendees.
- Streamed live attendance updates over WebSockets; validated APIs through Jest and Postman tests.
