EDUCATION

Vellore Institute of Technology (VIT)

B.Tech. Computer Science; CGPA: 8.51 / 10

Vellore, India

2023 – 2027

EXPERIENCE

Technology Intern

Mumbai, India

LEAD Group (Leadership Boulevard Pvt. Ltd.) | [Certificate](#)

May 2026 – July 2026

- Built AR Co-Pilot, an Accounts Receivable validation platform on a modular “Checklist-as-a-Service” architecture using FastAPI, SQLAlchemy, React, and TypeScript, automating manual PO reviews of about 20 minutes each.
- Engineered a 3-stage PO reconciliation pipeline: document retrieval from AWS S3 via ORP MySQL references, extraction of 5–20 line items per PO using a vision LLM, and reconciliation to flag unauthorized lines.
- Designed a 2-stage decision engine in which the LLM handles semantic item matching while deterministic Python performs quantity comparison and final verdict logic, keeping financial decisions auditable.
- Shipped a provider-agnostic LLM layer across Groq with AWS Bedrock fallback via LangChain, plus a finance-editable matching-rules studio for adjusting logic without code changes.
- Extended the platform with a deterministic deal-validation service reconciling PAN records from Google Sheets against HubSpot CRM via an n8n government-lookup webhook, classifying each into 5 audit verdicts.

Software Development Intern

Jaipur, India

Fudr | [Certificate](#)

May 2025 – July 2025

- Restructured Swagger/OpenAPI documentation for a production Spring Boot backend using GroupedOpenApi, organizing 66 controllers into module-specific groups, tags, and definitions for internal and external API consumers.
- Implemented field-level data exposure control with @JsonView and logic to hide internal endpoints from public documentation, tightening the API security surface.
- Integrated MySQL data flows and provisioned Redis in the backend; replaced hardcoded values with constants and refactored legacy configurations to improve maintainability of the codebase.
- Diagnosed and resolved critical production issues spanning JVM arguments, dependency conflicts, and security manager constraints, and untangled Spring Boot bean dependency cycles in a live environment.

TECHNICAL PROJECTS

DocGraph AI | Full-Stack GraphRAG Document Intelligence | Python, FastAPI, Neo4j, React | [GitHub](#)

2026

- Created a hybrid RAG system combining dense HNSW vector search with semantic graph traversals over Neo4j (GraphRAG), and orchestrated an asynchronous multi-agent FastAPI backend migrated to the Gemini Batch API to eliminate OOMs and rate-limit errors.
- Designed a write-time entity resolution engine using inline HNSW vector blocking with a 3-way similarity decision boundary to canonicalize entities across thousands of documents and prevent graph fragmentation.

MeshPay | Mesh-Routed Deferred Settlement Engine | Java, Spring Boot, JPA, H2 | [GitHub](#)

2026

- Engineered a Spring Boot backend for offline UPI payments routed through a Bluetooth-style mesh network, using hybrid RSA-OAEP + AES-256-GCM encryption to secure payment transit across untrusted intermediary devices.
- Implemented atomic exactly-once settlement via ConcurrentHashMap CAS on SHA-256 ciphertext hashes, preventing duplicate-storm debits when multiple bridge nodes deliver the same encrypted packet concurrently.
- Built a gossip-protocol mesh simulator with TTL-based hop propagation and a 5-stage bridge ingestion pipeline (hash → claim → decrypt → freshness check → settle) backed by optimistic-locking JPA transactions.

Classroom Assistant | Multi-Agent AI Tutor | React, TypeScript, Supabase, Google Gemini | [GitHub](#)

2026

- Built a distraction-free adaptive learning web app for students with ADHD, targeting Grade 2–5 Mathematics with a calm, minimal UI featuring Lottie animations and attention check-in breaks.
- Designed a multi-agent AI system (Teaching, Quiz, Report agents) orchestrated via graph-based routing, with all agent decisions logged for full transparency and traceability.
- Implemented RAG using pgvector on Supabase to ground the Teaching Agent’s explanations strictly in embedded curriculum content, with dynamic rewriting based on student grade and learning style.
- Tracked per-topic student mastery (*weak* / *in-progress* / *mastered*) and active misconception tags, enabling the Quiz Agent to adaptively target weak spots in real time.

TECHNICAL SKILLS

Languages: Java, Python, JavaScript, SQL

Backend & APIs: Spring Boot, FastAPI, Node.js, REST APIs

Databases: MySQL, MongoDB, Redis, Supabase, Neo4j

AI & Agentic Frameworks: LangChain, RAG, Multi-Agent Systems, LLM Function Calling, Vision LLMs, Prompt Engineering

Tools & Testing: Git, Postman, Swagger/OpenAPI, n8n

Core CS: Data Structures & Algorithms, Database Management Systems, OOP, Computer Networks, Operating Systems
